

MAGDEBURG LECTURES ON OPTIMIZATION AND CONTROL

Markus Schweighofer

Polynomial Optimization via Semidefinite Programming

Prof. Markus Schweighofer
Fachbereich Mathematik und Statistik
Universität Konstanz

Time & Place

The presentation will be given on April 18, 2013 at 5.30 p.m. and takes place in the seminar room V 0.05/2-3. › This is the Max-Planck-Institute at Sandtorstraße 1. (<http://www.de.mpi-magdeburg.mpg.de/institute/way.de.html>)

Abstract

Polynomial optimization is concerned with minimizing or maximizing a polynomial objective function subject to a finite number of polynomial constraints. The constraints are non-strict real polynomial inequalities in several variables. A very successful technique to solve

these problems has emerged since the turn of the millennium: The basic idea is to relax the problem by replacing all nonlinear monomials by new variables. As a matter of course, the resulting linear program would in general carry little information about the original problem. To delimit the loss of information during the linearization procedure, one adds infinite families of polynomial inequalities which are redundant in the original polynomial optimization problem but carry important information after being linearized. Each such family is chosen in a way such that it becomes a single linear matrix inequality when linearized. The linearized problem is no longer a linear program but still a semidefinite program and can therefore be solved efficiently. But what exactly do the optimal solutions of the original problem have to do with the original problem?
